## BACKGROUND INFORMATION

CD45RA is a 205–220 kDa isoform of the CD45 tyrosine phosphatase, expressed on naïve/resting T cells, medullary thymocytes, B cells, and monocytes. It is found on ~40–50% of peripheral $CD4^+$ T cells, ~50% of $CD8^+$ T cells, and subsets of B cells and monocytes. CD45RA enhances TCR and BCR signaling and associates with molecules like LPAP, CD1–CD4, and galectin-1. Its expression is regulated by cytokines and can be present on some activated T cells. CD45RA-specific antibodies (e.g., HI100) are widely used to identify naïve T cells and study $CD4^+$ suppressor/inducer subsets.

## PRODUCT DATA

Human Peripheral Blood Mononuclear Cells were stained with iF700 Anti-Human CD45RA clone HI100 (color-filled histogram) or an isotype control (gray histogram).
